Discrete-Time Signal Processing (3rd Edition) (Prentice ... - Digital signal processing is the processing of digitized discrete-time sampled signals. Processing is done by general-purpose computers or by digital circuits such as ASICs, field-programmable gate arrays or specialized digital signal processors (DSP chips). Typical arithmetical operations include fixed-point and floating-point, real-valued and complex-valued, multiplication and addition.

Signal processing - Wikipedia - The most common processing approach in the time or space domain is enhancement of the input signal through a method called filtering. Digital filtering generally consists of some linear transformation of a number of surrounding samples around the current sample of the input or output signal. There are various

ways to characterize filters; for example: Sat, 09 Feb 2019 18:48:00 GMT

TMS320C55x DSP Library Programmer's Reference - This is a shifted version of [0 1]. On the time side we get [-0.5 0.5] instead

of [-0.5 0.5], because our cycle isn't exactly lined up with our measuring intervals, which are still at the halfway point (this could be desired!). The Fourier Transform finds the set of cycle speeds, amplitudes and phases to match any time signal.

Looking at how to generate pink noise by two methods: 1 - A "pinking" filter for white noise. 2 - The Voss-McCartney algorithm of adding multiple white noise sources at lower and lower octaves.
